If you have a 2.5v super capacitor, you must NEVER charge it at a higher voltage. If you do, you risk damaging the integrity of the capacitor, or worse, an explosion.

You can charge a supercapacitor by connecting its positive and negative terminal to the power supply's positive and negative end, respectively. Applying more voltage than the supercapacitor's limit can ...

Put that resistor/lightbulb in series too, it will prevent over-current when the capacitor is first connected in a flat state. It will also prevent the diode from being damaged by large currents. ...

A simple voltage regulating LED driver with constant current, usually regulated by sensing a low side, series current sense resistor, then a voltage clamp can be used to charge a super capacitor.

The resistor does get quite warm at first but the power running through it tapers off logarithmically. In practice, the circuit below takes over 3 hours to pre-charge a bank of twenty-four ...

To charge a supercapacitor efficiently and safely, a proper charging circuit is required. This guide will cover everything you need to know about supercapacitor charging circuits, including:

Attach one end of the charging resistor to the power wire leading to the capacitor module. It is highly suggested that you place a fuse before the capacitor. This is to insure that if the capacitor were to be ...

I bought a car audio 1 farad capacitor and need to know what type of resistor to charge it with and where I can buy them or where I can buy the capacitor charging kit.
