Will solar power and wind power grow in 2027?

We expect the combined share of generation from solar power and wind power to rise from about 18% in 2025 to about 21% in 2027. In our STEO forecast, utility-scale solar is the fastest-growing source of electricity generation in the United States, increasing from 290 BkWh in 2025 to 424 BkWh by 2027.

Will wind and solar replace coal in 2022?

A decade of coal plant retirements and renewable energy installations have seen the technologies swap positions in the country's power stack. In 2022, the combination of wind, solar and other renewables like hydropower and geothermal collectively eclipsed coal. Now, wind and solar are doing it on their own.

What happened to solar power in 2024?

In 2024, wind and solar nudged out coal, accounting for 15.5 percent of utility power generation to 15.2 percent for coal. The tipping point followed a surge in solar installations last year. The 30 GW of new solar capacity installed in 2024 smashed the previous record of 19 GW set in 2023.

Why should you invest in solar energy?

Millions of Americans are deciding to power their homes with solar energy--especially as costs have decreased--but an investment in solar energy generates more than just clean energy. It can support household savings, energy independence, economic opportunities, grid reliability, resilience, security and affordability, and a safer planet.

A research team from Xidian University has wrapped up the world's first full-chain, system-wide ground verification for space solar power station this month, displaying multiple key know-hows for the ...

To reveal more clearly the potential benefits of a Global super grid for solar power development, we investigate one extreme scenario (Time zone smoothing scenario) with a low cost for solar power, ...

When impending drought threatened energy security in April 2024, the government turned to water rationing to compensate for the lack of solar power (Interview 61). Despite the promise of foreign ...

In 2024, wind and solar nudged out coal, accounting for 15.5 percent of utility power generation to 15.2 percent for coal. The tipping point followed a surge in solar installations last...

We expect the combined share of generation from solar power and wind power to rise from about 18% in 2025 to about 21% in 2027. In our STEO forecast, utility-scale solar is the fastest ...

If you thought solar energy was just a niche player in America's energy mix, 2024 proved otherwise. Last year wasn't just a win for solar--it was a full-blown revolution. Let's unpack how ...

China's solar power capacity has increased rapidly in recent years and it is now racing ahead of the rest of the world. Michael Rae, Global Equities Fund Manager, examines the factors behind this growth ...

The United States increased its electricity generation from utility-scale solar power by nearly one-third in the first half of this year compared to the same period last year.
