This becomes especially critical when panels are connected in series, as these increases multiply. Two 40V panels in series rated at 80V total could potentially output 96V in freezing conditions.

Current Behavior: The current remains the same as that of a single panel. For example, if three solar panels rated at 40V and 10A are connected in series, the system will produce 120V and ...

Solar panels wired in series increase the voltage, but the amperage remains the same. Solar inverters may have a minimum operating voltage, so wiring in series allows the system to reach that threshold.

Since the two 5A - 60V series strings are then wired in parallel, we add the amps while not changing the volts because parallel wired solar panels (or series strings) get their amps added while their volts ...

Both the voltage and amperage need to be considered when designing your system, especially when it comes to finding an inverter that will work best for you.
