---

So, the form of the wind turbine generator needed for a special location is based on the power contained in the wind and the features of the electrical system itself.

Imagine a weapon so powerful that it could knock down enemy aircraft without firing a single bullet! The Wind Cannon was a bizarre yet fascinating invention,...

The operator proudly claims it uses "wind power," and suddenly you're wondering - why aren't these things generating electricity? Let's cut through the confusion surrounding pneumatic wind cannons ...

As you might expect, this project never got anywhere, either - but the idea lived on. The United States considered vortex- and wind machines for crowd and mob control in the early 70s, once again ...

According to Hogg, the Whirlwind Cannon could break 100 mm (4 in) boards at a distance of 180 m (200 yd). Ultimately the gun failed to produce the desired effect on enemy aircraft and the project was ...

The wind cannon generated "slugs" of compressed air using combustion of hydrogen and oxygen inside of a long barrel that was bent at one end. These blasts were intended to destabilise aircraft in flight, ...

In the early 1970s, the United States showed particular interest in developing "vortex rings and wind-generation machines" for "crowd and mob control," but no known result emerged.

The design of the Wind Cannon involved large pipes that could generate toruses of wind through a long bent barrel at one end, using combustion of hydrogen and oxygen. [1]
