OverviewHistorySystems and principlesDesign concernsInfillsFire safetyMaintenance and repairExternal linksCurtain walls are non-structural exterior building walls. They protect the interior of the building from the elements but since they carry no structural load beyond their own dead-load weight, they can be made of lightweight materials. They transfer lateral wind loads to the main building's structure through connections at floors or columns. Curtain walls may be designed as "systems" that integrate frame, wall panel, and we...

There are multiple factors to consider when designing a curtain wall system to accommodate expected movement, including thermal expansion and contraction, movement due to ...

However, glass makes the effects of light on visual comfort and solar-heat gain in a building more difficult to control. Other common infills include stone veneer, metal panels, louvres, and operable ...

The current paper presents a study of the effect of equatorial-facing facade design on energy performance of multi-story buildings. Facade surfaces are assumed to be in the form of ...

There is no single method, path or outcome for resolving conflicts and contradictions in design by integrating various factors, but safety first and coordination should be the most basic ...

This paper presents curtain walls, their fundamental classification, challenges associated with their design and construction. A balanced, holistic approach to the curtain wall construction is emphasized.

The objective of this study is to analyze the effect of manipulating the design of curtain wall facades in multistory buildings on energy performance and on the level and spatial distribution of daylighting.

During the design and construction process of a replacement curtain wall, there are several important points to take into consideration. Cost is a factor; therefore, a choice must be made between a ...
