Humans have been using solar energy for centuries and first produced solar-powered electricity in the United States in 1954. Currently, solar energy can generate electricity in two ways: ...

Solar electricity is growing rapidly, but can it really dominate the global energy system? Here is what it will take for us to power the planet on sunshine

Unlike fossil fuels, which emit greenhouse gasses when burned, solar power generation is markedly clean, producing minimal to no emissions. By harnessing solar energy, we can make ...

Solar energy is created by nuclear fusion that takes place in the sun. It is necessary for life on Earth, and can be harvested for human uses such as electricity.

While the sun is a powerful energy source that sustains nearly all life on Earth, humans are not "solar powered" in the same way plants are. Humans do not possess the biological ...

This dataset contains yearly electricity generation, capacity, emissions, import and demand data for over 200 geographies. You can find more about Ember's methodology in this ...

Virtually nonpolluting and abundantly available, solar power stands in stark contrast to the combustion of fossil fuel and has become increasingly attractive to individuals, businesses, and ...

Solar power, also known as solar electricity, is the conversion of energy from sunlight into electricity, either directly using photovoltaics (PV) or indirectly using concentrated solar power.
