What causes solar panel discoloration?

However, in the realm of solar panels, this discoloration is a deeper phenomenon with potential consequences. Solar panel discoloration is a physical change in the panel's color due to environmental factors or material degradation, especially the yellowing or browning of their once clear and shiny surfaces.

What are the different types of solar panel discoloration?

Let's explore the most common types of solar panel discoloration: One of the most noticeable forms of discoloration is the yellowing or browning of the solar panels. This issue occurs due to the degradation of ethyl vinyl acetate (EVA), a material used as an encapsulant in the panel.

Why do solar panels turn grey?

With prolonged exposure to sunlight, the EVA starts to oxidize and causes the surface to change color. Dirt, dust, bird droppings, and other environmental factors can also cause solar panel discoloration. Furthermore, pollution has been linked to causing a greyish hue on solar panels.

Why do solar panels turn yellow?

This discoloration is due to an uncontrollable chemical reaction in the panel materials. Studies have shown that acetic acid plays a crucial role in turning the EVA encapsulate yellow. This reaction happens between chemicals on the silicon solar cell surfaces and those used to treat the glass.
