-----

At the front of the nacelle is a hub, which is where the blades meet and connect. Together, the hub and blades make up the rotor, so called because it rotates as the wind blows. As with all of the other ...

Wind turbines work on a very simple principle: the wind turns the blades, which causes the axis to rotate, which is attached to a generator, which produces electricity (typically variable ...

Wind flows over the blades creating lift (similar to the effect on airplane wings), which causes the blades to turn. The blades are connected to a drive shaft that turns an electric generator, ...

Wind turbines are modern-day souped-up versions of the windmills used throughout the ages, only now they convert wind into electricity that powers your home. Several types of wind ...

Wind turbines work on a simple principle: instead of using electricity to make wind--like a fan-- wind turbines use wind to make electricity. Wind turns the propeller-like blades of a turbine around a rotor, ...

Wind turbines operate on a simple principle: the wind turns two or three propeller-like blades around a rotor, which is connected to the main shaft. This causes the axis to rotate, which is ...

The wind blades of a turbine are the most important component because they catch the kinetic energy of the wind and transform it into rotational energy. Wind turbine blades appear in a ...

A wind turbine turns wind energy into electricity using the aerodynamic force from the rotor blades, which work like an airplane wing or helicopter rotor blade. When wind flows across the blade, the air ...
