-----

In conventional wind turbines, the blades spin a shaft that is connected through a gearbox to the generator. The gearbox converts the turning speed of the blades (15 to 20 RPM for a one-megawatt ...

Simply put, a wind turbine generator is a device that converts the energy of the wind into electricity. It consists of large blades that spin when the wind blows, turning a rotor connected to a generator. The ...

OverviewNacelleAerodynamicsPower controlOther controlsTurbine sizeBladesTowerThe nacelle houses the gearbox and generator connecting the tower and rotor. Sensors detect the wind speed and direction, and motors turn the nacelle into the wind to maximize output. In conventional wind turbines, the blades spin a shaft that is connected through a gearbox to the generator. The gearbox converts the turning speed of the blades (15 t...

This includes blades that capture energy and a rotor hub that connects the blades to the shaft, along with pitch mechanism that assists in efficient capture of energy.

Takeaway: Small blades require high wind speeds to start spinning, that's why they're commonly used as sailboat wind turbines. Larger blades require less wind for start up and provide ...

Wind turbine blades have been designed in many shapes and styles throughout the evolution of wind energy technology. The blade of a modern wind turbine is now much lighter than older wind turbines ...

Wind turbine blades are the aerodynamic structures that extract kinetic energy from moving air. Designed with airfoil shapes, they generate lift, which rotates the hub and drive train. ...

Wind turbines work on a simple principle: instead of using electricity to make wind--like a fan--wind turbines use wind to make electricity. Wind turns the propeller-like blades of a turbine around a rotor, ...
